# papyrus

## Documents in HTML, printed to PDF.

papyrus is a documents engine. You write a document as HTML or React pages. On screen each page is a sheet of A4 or US Letter paper, and the same pages print to a PDF.

> **Young and still changing.** Versions are dates (YY.M.R), not semantic versions, so any release may break things. Pin an exact version and read the changelog before you upgrade.

1. What it is ..... 2

2. Two packages, one version ..... 2

3. One element, one sheet, one page ..... 2

4. The PDF check ..... 2

A. Versions and licence ..... 2

This sheet is itself a papyrus document: each page is an element with the class `pdf-page`, and its PDF was printed by `papyrus pdf` after the page count was checked.

## 1. What it is

papyrus is a documents engine. You write a document as HTML or React pages. On screen each page is a sheet of A4 or US Letter paper, and the same pages print to a PDF. A report or a resume stays one source for the web and for print.

## 2. Two packages, one version

| PACKAGE | WHAT IT IS | SHIPS |
|---|---|---|
| **@n-uf/papyrus** | The engine, with no framework: the page contract, sheet sizes and print CSS, the document registry and the PDF exporter. | Plain ESM JavaScript with type declarations |
| **@n-uf/papyrus-react** | React components on top of the engine: page and content blocks, a document registry typed for React, and print styles. | TypeScript source |

Both carry no brand, copy or content of their own; your documents supply those. They are released together at one version.

## 3. One element, one sheet, one page

Every element with the class `pdf-page` is one sheet on screen and one page in the PDF. `sheetCss()` sizes it to A4 (210 × 297 mm) or Letter (8.5 × 11 in) and keeps one per printed page.

```
import { SHEETS, sheetCss } from "@n-uf/papyrus";

const css = sheetCss(SHEETS.LETTER);  // US Letter sheets
```

## 4. The PDF check

The `papyrus` command prints every document in a config file through headless Chromium. It checks every PDF before writing it: the number of pages in the HTML, the PDF's own page count and the count you expect must agree. If they don't, for example because a page overflowed onto an extra sheet, the export stops instead of writing the file.

```
papyrus pdf --config papyrus.config.json
```

## A. Versions and licence

Calendar versions, `YY.M.R`: `26.11.0` is the first release of November 2026. Licence: PolyForm Perimeter 1.0.1.
